Quality Assurance Inspector (QAI) Rodney Patterson was at the American Bridge/Fluor (ABF) job site at Yerba Buena Island in California between the times noted above in order to monitor Quality Control functions and the in process work being performed by ABF personnel. The following items were observed:

The QAI performed a minimum of 10% verification and was directed by the QA lead to scan the weld utilizing scanning pattern D only for the detection of indications oriented transverse to the weld axis. Due to contract requirements the weld was ground flush after being previously accepted by ABF QC. No rejectable indications were noted at the time of inspection; however recordable indications were observed to be present and reported by ABF QC inspectors. The following welds were tested utilizing scanning pattern D only;

13W-14W-A2.2

13W-14W-A3

13W-14W-A4

13W-14W-A5

The QAI spent a portion of this shift reviewing and documenting the status and completion of various production welding tracking logs for lift 13E/14E drop-in deck work currently in-process. The QA recorded the information on the OBG tracking log.

Unless otherwise noted, all work observed on this date appeared to generally comply with applicable contract documents.
